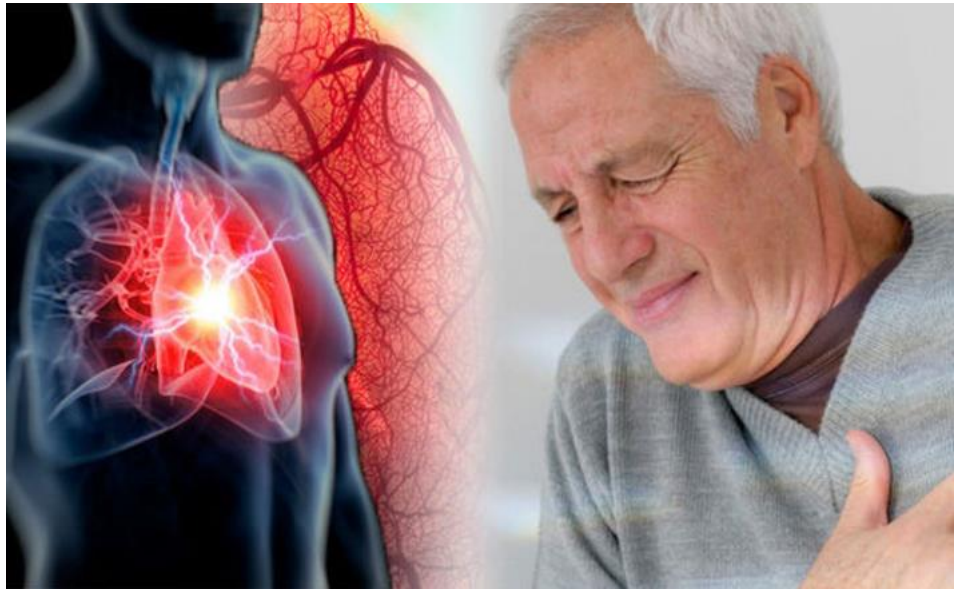
Introduction

Heart Disease Detection

Some facts about

Heart Disease



A heart attack occurs when the blood flow that brings oxygen to the heart muscle is blocked

610,000

Leading cause of death

About **610,000 people** die of heart disease in the United States every year–that's **1 in every 4 deaths.**

735,000

Yearly

Every year about **735,000 Americans** have a heart attack. Of these, **525,000** are a first heart attack.

Our Goal

Building a model to assist doctors to detect whether these patients are under a high risk of heart disease

Data Set Introduction

Project Overview

Data Pre-processing

Data exploration & cleaning

1

Build Model

2

Compare the performance of KNN; Logistic Regression; Decision Tree; Random Forest

Pickle generator

Save the result of Classification

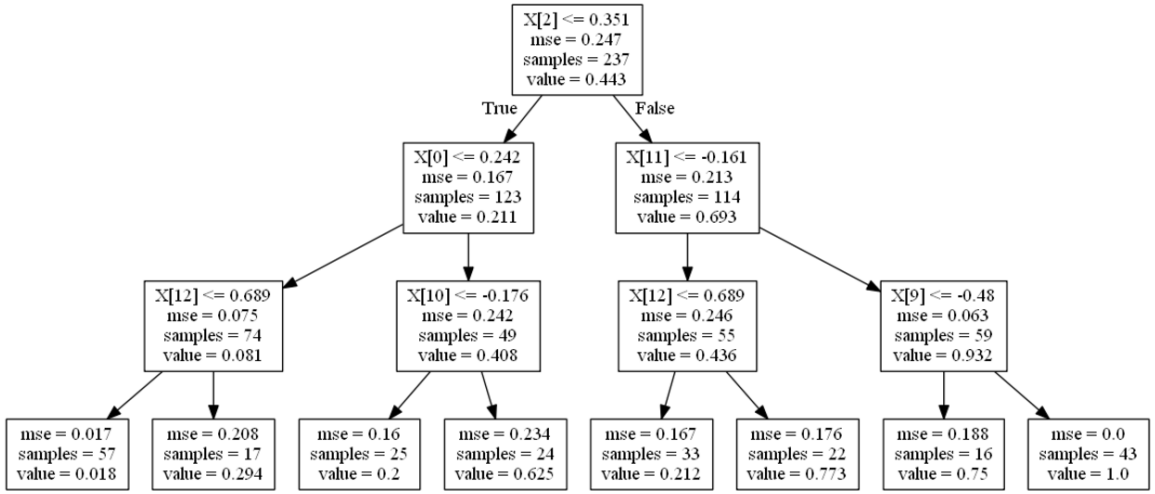
3

Build website

4

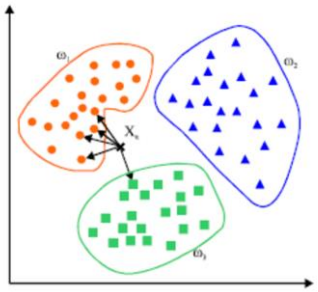
Use flask to build our heart disease prediction website

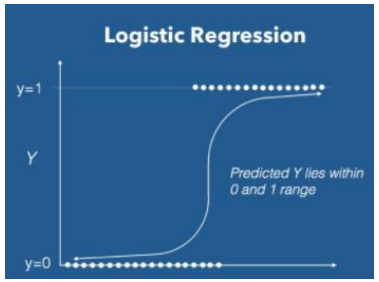
2

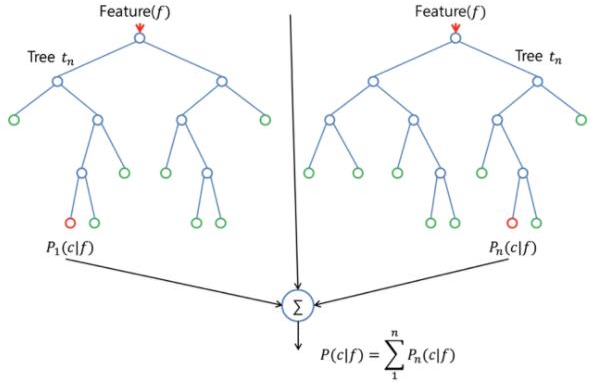


Building Model

Comparison of four models:
1) KNN 2) Logistic Regression
3)Decision Tree 4) Random Forest







Model Selection

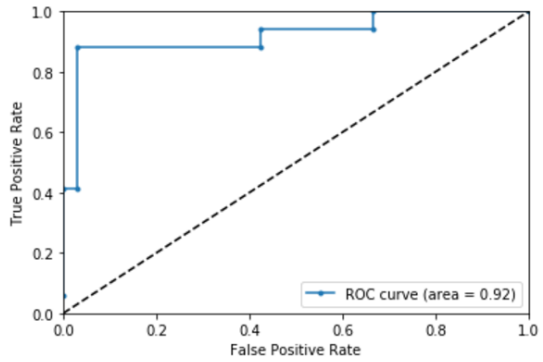
Based on Accuracy, ROC Curve

Choose

Logistic Regression

R^2 = 0.843

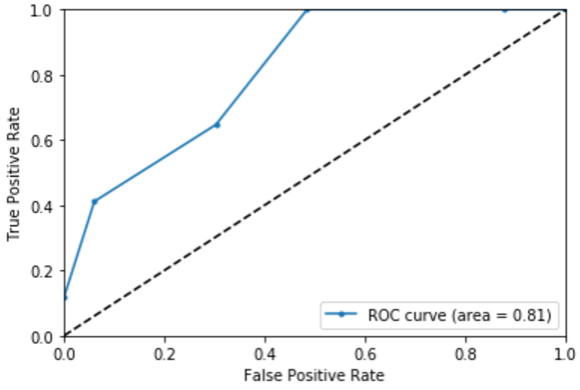
Area under the ROC curve : 0.921569



KNN Classification

84% Accuracy

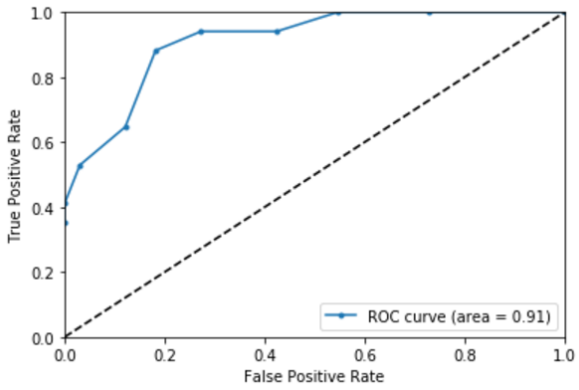
Area under the ROC curve : 0.809269



Random Forest Classifier

R^2 = 0.774

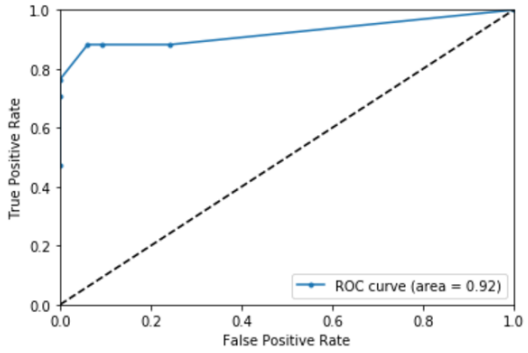
Area under the ROC curve : 0.911765



Decision Tress

R^2 = 0.604

Area under the ROC curve : 0.923351



The optimal depth is 3. R^2 is not good enough. AUC is 0.923.

Heart Disease Detection

Age:

Sex:
Female

Chest pain type:
typical angina

Resting blood pressure:
mmHg

Serum cholestoral:
mg/dl

Fasting blood sugar over 120 mg/dl?
no

Resting electrocardiographic results:
0
Value 0: normal
Value 1: ST-T wave abnormality
Value 2: left ventricular hypertrophy

Maximum heart rate achieved:

Exercise induced angina?
yes

ST depression induced by exercise relative to rest:

The slop of the peak exercise ST segment:
upsloping

Number of major vessels colored by flourosopy:

thal:
normal

Submit

Healthy
